

The AI Agent That **Pays for Truth.**

Verifiable answers. Real payments. **On-chain** receipts.

PITCH DECK

THE DATA FREE PROBLEM

High-quality data is locked behind paywalls, undervalued, and **impossible to verify**.

01

PUBLISHERS UNPAID

Agents scrape publisher content and pay nothing. The people producing the data see none of the value their work creates.

02

AGENTS READ CHEAP

The good data sits behind paywalls. Agents grab whatever is free instead, so answers get built on the weakest sources.

03

NO PROOF AT ALL

There is no way to check what an answer was built from. You get a citation list and a promise. Nothing verifiable.

HOW IT WORKS

Verified answers. Paid in stablecoins.

01

Intent first.

Before spending anything, Qerin works out what is actually being asked. Vague questions get clarified, not guessed at. This is what stops the agent paying for the wrong sources.

02

Selection.

Sources ranked by relevance and cost. Only what is worth buying gets bought.

03

Payment and retrieval.

Qerin pays each source in USD on Base through \$402, autonomously, with no human approval per call. It then pulls the real content behind the paywall.

04

Proof.

Every payment is written to a receipt contract and returned with the answer, checkable by anyone.

 Near term: first source integrations live, MCP distribution so any agent can call Qerin, and the first API design partners running real queries against real money.

 Then: publisher self-serve payouts, reputation built from real payment history, cross-chain settlement. The receipt becomes the standard.

VISION

A large, stylized orange scribble or signature line that starts under the letter 'N' and extends to the right across the bottom of the slide.

The Team

Builders. Partners.
Problem solvers.

We combine deep product expertise with growth strategies and strong partnerships to build, scale, and drive impact.

Rahul Pandey

FOUNDER

Builds and ships products end to end. Closed 12+ ecosystem partnerships at TempWallets, including India Blockchain Week.

Product at ORIN HQ. Selected for Google X Antler and DevLabs Momentum.

Peculiar Ekong

CMO

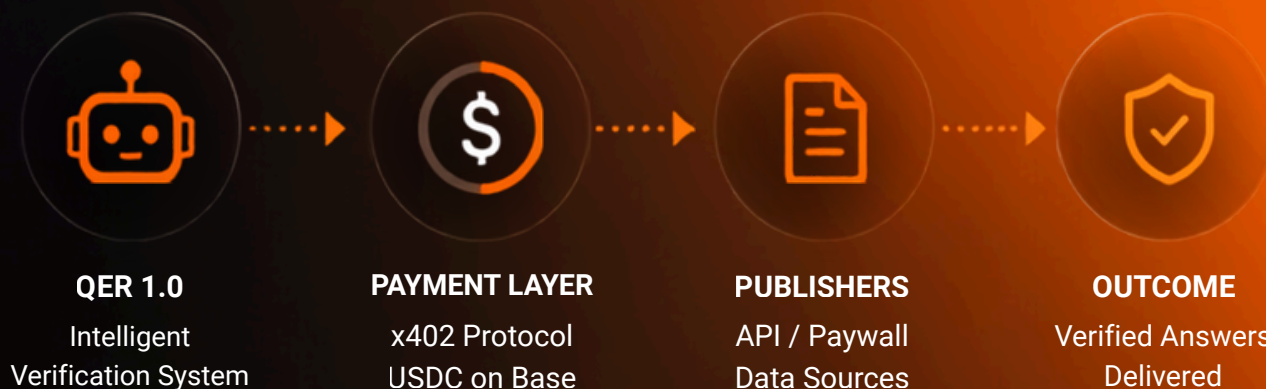

Runs distribution, community and the partner pipeline.

Worked with Injective, Elympics and Avalanche and will be focused on converting visibility into users, partnerships, and sustainable growth.

BUSINESS MODEL

Verified answers.
Paid in stablecoins.

PAID PER OUTCOME
Not per seat.

ON-CHAIN PAYOUTS
Publisher revenue
settles on-chain.

OUTCOME-BASED PRICING
AI pricing aligned
with value delivered.

WHY NOW

x402 turns machine payments into a standard HTTPS call.

Stablecoins on Base make sub-cent payments economically viable.

Agents are shifting from answering questions to taking actions with real money attached.

Publishers want a model that is not ads or subscriptions.

The infrastructure now exists.
The layer that uses it does not.

TARGET MARKET

Research and analyst tools.

Crypto and financial data platforms. Anywhere an unsourced answer costs the customer money, sourcing has to be defensible.

Enterprise assistants under compliance pressure.

Regulated teams cannot ship answers they cannot trace. An itemised receipt is the audit trail they already need.

Agent frameworks and MCP tool distributors

That need a payments layer they did not build themselves.

Consumer AI apps where citation integrity is the product.

Apps built around research and answers always need citations, users can actually verify.

STATUS

Working today, Qerin can pay a source, get the real content back, and hand over a receipt anyone can check. The proof layer is live and open for verification.

No
live users.

No
revenue.

No
partners signed.

We are **pre-launch** and we say so plainly, because a product built on proof cannot inflate its own numbers.

VERIFIED ANSWERS.

THANK YOU

— LET'S BUILD WHAT MATTERS. —
